                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   QΥ
A method has been developed for the production of protein hydrolysates (PH) comprising reacting a protein with: (1) at least one polypeptide with Gly-releasing activity; and (ii) at least one other protease so that the amount of Gly produced is greater than when the protease is cused alone. PH are used to improve flavour of foods (e.g. baked goods) and as animal feed additives. PH are preferably also enriched in Glu (free and/or peptide bound), so have improved flavour and palatability. Addition of a polypeptide with Gly-releasing activity increases the degree of hydrolysis (or reduces the amount of enzyme needed) and crust colour. The present sequence encodes Aspergillus oryzae aminopeptidase II, which is used in the method of the invention. Sequence 1491 BP; 335 A; 438 C; 426 G; 292 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WO9851163-A2.

New aminopeptidase from Aspergillus oryzae - used to produce protein hydrolysates enriched in particular amino acids, used as flavour enhancers, e.g. in doughs:

Claim 1; Fig 1; 92pp; English.

The present sequence encodes aminopeptidase (AP) II from Aspergillus oryzae. AP is used in combination with an endopeptidase (EP) to oryzae. AP is used in combination with an endopeptidase (EP) to hydrolyse polypeptides, producing protein hydrolysate (PH), useful in foods as flavour enhancer, e.g. in baked goods, enriched in: (a) Leu, Gly (especially), Glu, Ser, Asp, Asn, Pro, Cys, Ala and/or Gln, or (b), if the substrate has been deamidated, in Glu (free and/or peptide bound), used in flavour-improving compositions (optionally containing EP) and in dough pre-mixes. Also AP can be used for deactivating enzymes and for converting precursors to mature proteins. AP increases the level of
                                                                                                                                                                                                                                                                                                                                                                                         x00018 standard; DNA; 1491 BP.

enhancers, e.g. in doughs

Example 12; Page 55; 92pp; English.

The present sequence represents a PCR primer for aminopeptidase

(AP) II. AP is used in combination with an endopeptidase (EP) to
hydrolyse polypeptides, producing protein hydrolysate (PH), useful in
foods as flavour enhancer, e.g. in baked goods, enriched in: (a) Leu,
Gly (especially), Glu, Ser, Asp, Asn, Pro, Cys, Ala and/or Gln, or (b),
if the substrate has been deamidated, in Glu (free and/or peptide bound),
in which case products are useful as animal feed additives. AP can be
used in flavour improving compositions (optionally containing EP) and in
dough pre-mixes. Also AP can be used for deactivating en:ymes and for
converting precursors to mature proteins. AP increases the level of
hydrolysis of proteins and thus of flavour development. 19th have improved
solubility, emulsifying and foaming properties, and products containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Aspergillus oryzae aminopeptidase II PCR reverse primer #2.

                                                                                                                                                                                                                                                                                                                             Example 12; Page 28; 84pp; English.

A method has been developed for the production of protein hydrolysates (PH) comprising reacting a protein with: (i) at least one polypeptide with Gly-releasing activity; and (ii) at least one other protease so that the amount of Gly produced is greater than when the protease is used alone. PH are used to improve flavour of foods (e.g. baked goods) and as animal feed additives. PH are preferably also enriched in Glu (free and/or peptide bound), so have improved flavour and palatability. Addition of a polypeptide with Gly-releasing activity increases the degree of hydrolysis (or reduces the amount of enzyme needed) and hydrolysates have better solubility, and emulsifying and foaming properties. Baked goods containing them have improved aroma, mouthfeel and crust colour. The presents general live of the presents and polyperties are proportion of the presents and polyperties are proportions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Aspergillus oryzae aminopeptidase II PCR reverse primer #2. Aminopeptidase; protein hydrolysate; glycine releasing; protease; proteinaceous material; flavour; food; baking; animal feed additive; palatability; hydrolysis; solubility; emulsifying; foaming; aroma; mouthfeel; crust colour; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1471 CATTCTCAAGTCGAGGCATAG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              hydrolyse polypeptides, producing protein hydrolysate (PH), useful in foods as flavour enhancer, e.g. in baked goods, enriched in: (a) Leu, Gly (especially), Glu, Ser, Asp, Asn, Pro, Cys, Ala and/or Gln, or (b), if the substrate has been deamidated, in Glu (free and/or peptide bound), in which case products are useful as animal feed additives. AP can be used in flavour-improving compositions (optionally containing EP) and in dough pre-mixes. Also AP can be used for deactivating enzymes and for converting precursors to mature proteins. AP increases the level of hydrolysis of proteins and thus of flavour development. PH have improved solubility, emulsifying and foaming properties, and products containing them have better flavour, palatability and aroma.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ş
                                                                    PT New aninospeptidase from Aspergillus oryzae - used to produce protein protein hydrolysates enriched in particular amino acids, used as flavour protein hydrolysates enriched in particular amino acids, used as flavour protein hydrolysates enriched in particular amino acids, used as flavour protein hydrolysate (EP) to combination with an endopeptidase (EP) to hydrolyse polypeptides, producing protein hydrolysate (PH), useful in foods as flavour enhancer, e.g. in baked goods, enriched in: (a) Leu, Cly (especially), Glu, Ser, Asp, Asn, Pro, Cys, Ala and/or peptide bound), if the substrate has been deamidated, in Glu (free and/or peptide bound), in which case products are useful as animal feed additives. Ap can be used in flavour-improving compositions (optionally containing EP) and in cused in flavour-improving compositions (optionally containing EP) and in converting precursors to mature proteins. Ap increases the level of hydrolysis of proteins and thus of flavour development. PH have improved solubility, emulsifying and foaming properties, and products containing them have better flavour, palatability and aroma.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (PH) comprising reacting a protein with: (i) at least one polypeptide with Gly-releasing activity; and (ii) at least one other protease so that the amount of Gly produced is greater than when the protease is used alone. PH are used to improve flavour of foods (e.g. baked goods) and as animal feed additives. PH are improved flavour and palatability. Addition of a polypeptide bound), so have improved flavour and palatability. Addition of a polypeptide with Gly-releasing activity increases the degree of hydrolysis (or reduces the amount of enzyme needed) and hydrolysates have better solubility, and emulsifying and foaming properties. Baked goods containing them have improved aroma, mouthfeel and crust colour. The present sequence represents a PCR primer for the invention
                                                                                                                                                                                                                                                                                                                                                                                                                              (NOVO ) NOVO NORDISK BIOTECH INC.

S Example 12; Page 28; 84pp; English.

C A method has been developed for the production of protein hydrolysates

C (PH) comprising reacting a protein with: (i) at least one polypeptide

C with Gly-releasing activity; and (ii) at least one other protease so

C that the amount of Gly produced is greater than when the protease is

CC used alone. PH are used to improve flavour of foods (e.g. baked goods)

CC and as animal feed additives. PH are preferably also enriched in Glu

CC (free and/or peptide bound), so have improved flavour and palatability.

CC Addition of a polypeptide with Gly-releasing activity increases the

CC degree of hydrolysis (or reduces the amount of enzyme needed) and

CC hydrolysates have better solubility, and emulsifying and iomaing

CC properties. Baked goods containing them have improved aroma, mouthfeel

CC and crust colour. The present sequence represents a PCR primer for

CC contains a polypeptidase II, which is used in the method of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence is a fragment of a DNA sequence of the invention. The DNA sequence encodes a lepidopteran GABA (gamma amino butyric acid) gated chloride channel subunit protein, specifically the Heliothis virescens GABA gated chloride channel subunit protein. Cells expressing the recombinant proteins, especially Xenopus oocytes or Sf9 insect cells, or membrane preparations of such cells, can be used to produce the proteins or to screen for lepidopteran GABA-gated chloride channel agonists or antagonists that may be useful as insecticides for controlling lepidopteran pests, e.g. Heliothis virescens. GABA is a major inhibitory neurotransmitter in mammals and insects, with the channel beautical characteristic them.

This genomic DNA molecule comprises the BamHI F fragment and part of the BamHI C fragment of the orf virus strain NZ-2 genome incorporating putative promoter sequences for the FIL, FZL, F4R and CIR genes as well as intergenic regions suitable as foreign gene insertion sites. A claimed parapoxvirus vector comprises a parapox virus (especially an orf virus) containing exogenous DNA.

C vector fragments or variants with equivalent immunological activity and host cells (especially bovine or ovine testis cells) incorporating the vector are also claimed. The vector and fragments/variants are useful in vaccine production (claimed), since they can express antigens, useful in medical and veterinary applications e.g. parasitic disease control in livestock. Particular antigens include HIV envelope protein, heapes simplex glycoprotein, antigens of Echinococcus granulosis, Tichostronglylus, Haemonchus, Ostertagia and especially Taenia ovis 45W, 16 kd, 18 kd antigens. The foreign gene is preferably incorporated in a non-essential region of the virus genome (see 79135-61) under control of a poxvirus promoter, especially orf virus promoter EIL, FIL or F3R (see 79136-64). The orf virus vectors limit the cross-species infection common with e.g. vaccinia virus vectors, since the virus
                                                                                                                                                                                                                                                                                    virus, especially orf virus, and exogenous DNA encoding polypeptide, e.g. an antigen useful in vaccines Claim 12; Fig 7; 73pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     200
                                                                                                                                                                                                                                                                                   secreted proteins expressed in prostate, and encode the proteins given in xi 11716 to x11993 respectively. The proteins given represent the signal peptide and an N-terminal fragment of a secreted protein. The nucleic acid sequences can be used for producing secreted human gene products. They can also be used to develop products for diagnosis and therapy. The proteins obtained may have cytokine activity, cell proliferation and differentiation activity, haematopoiesis regulating activity, tissue growth regulating activity, reproductive hormone regulating activity, chemotactic/chemokinetic activity, haematory activity, tumour inhibition activity or other activities. The products and thrombolytic activity receptor/ligand activities. The products can be used in forensic, gene therapy and chromosome mapping promoter sequences can also be used for obtaining corresponding promoter sequences. The nucleic acids encoding the signal peptides can be used for directing extracellular secretion of a polypeptide or the insertion of a polypeptide into a cell.

                                                                                                                                                                                                                                                                                                                                                                                                                                              PT DNA encoding Arabidopsis SCARECROW protein - useful to modify plant PT cell division and therefore alter root development, or alter plant PT stem or hypocotyl gravitropism
PS Claim 6; Fig 9; 221pp; English.

CC This sequence comprises a partial cDNA clone of the Arabidopsis SCARECROW (SCR) SRPa3 gene, identified by homology to the CSCARECROW (SCR) SRPa3 gene, identified by homology to the Arabidopsis SCR gene (see T95753). It encodes a 325-amino acid polypeptide (see W38180). SCR is expressed specifically in embryo CC corot progenitor tissue and in certain root and stem tissues. It cregulates a specific asymmetric division, and controls gravitropic molecules (see T95753-66) encoding SCR protein sequences (see W38178-201), SCR proteins lacking 1 to 4 of MOTIFs 1 to VI; or CSCR MOTIF 1, II, IV, V or VI are claimed. Transgenic plants CC increased in roots, resulting in thicker root development, while a CC plant with an altered stem or hypocotyl gravitropism is less consceptible to lodging. Plants that contain an antisense molecule that suppresses the expression of endogenous SCR gene CC placed under control of a SCR promoter and expressed in a plant to CC confer herbicide, salt, pathogen or insect resistance, or when CC expressed in stems to increase starch, lignin or cellulose biosynthesis (all claimed).

Sequences derived from porcine brain natriuretic gene can be used in as probes to isolate similar genes from different species. Although h natriuretic related peptides (NRP) could not be isolated directly, can NRPs could be, and these could then be used as probes to their human continues.

/note="blast is one of the most devestating fungal diseases
of rice world wide. It is a filamentous ascomycete with
a haploid genome (n=7) of approximately 40 Mbp. Rice
blast is an important model fungal pathogen for studying
numerous aspects of the fungal-host interaction. In
order to facilitate genome wide analysis, a BAC library
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /clone_llb="Trypanosoma cruzi random genomic library"
